CST2355 – Database Systems Lab Assignment 2

Student Name: Fei Lan
Student ID: 041055048
Student email: lan00012@algonquinlive.com

Hand-in:

1. The lab assignment will be graded out of a maximum 4 points.
2. This template should be used to submit your lab assignment.
3. Make sure you have enough screenshots to completely document that you have completed all the steps.

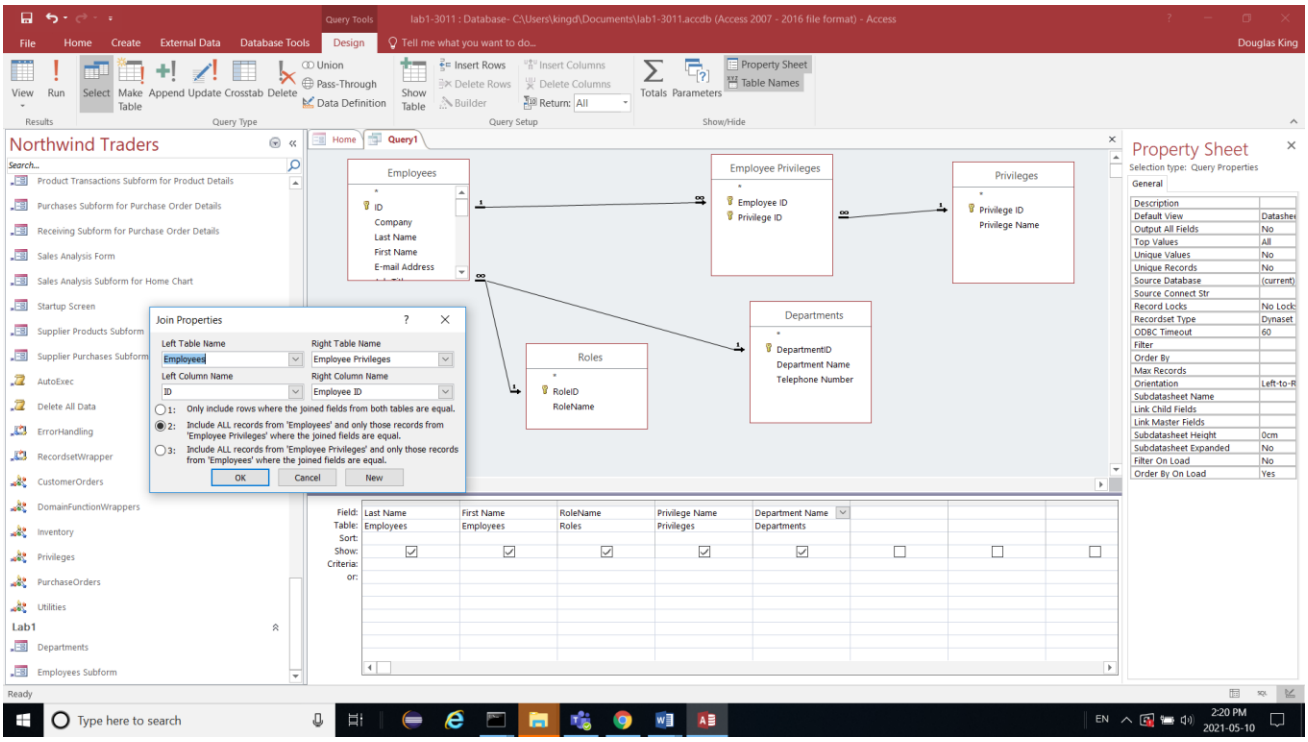
Activities (Steps):

1. Continue using the copy of the Northwind online database template that you used for Lab Assignment 1 (if necessary create a new one – with the Departments and Roles tables too).

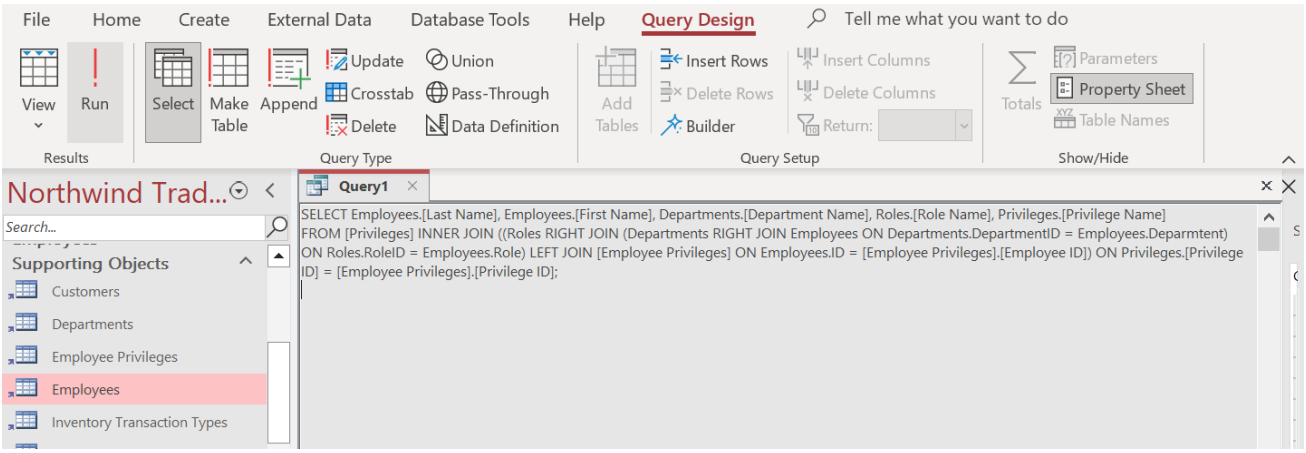
2. Move the form that you created for Lab 1 into a new subgroup called “Lab 1”. Then, move the sub-form that you created for the employee data into the same Lab 1 group.

3. Use the Query Tool to create a new Query that creates a joined view of all the employee, department, role, and privilege information by joining the employee table with the associated tables (see below). Take careful note of the properties of the joins between the tables: e.g., the arrow on the link between Employees and Employee Privileges. By specifying the join properties, the wizard will use the appropriate LEFT JOIN, RIGHT JOIN, or INNER JOIN when creating the query.

© 2021 Algonquin College of Applied Arts and Technology



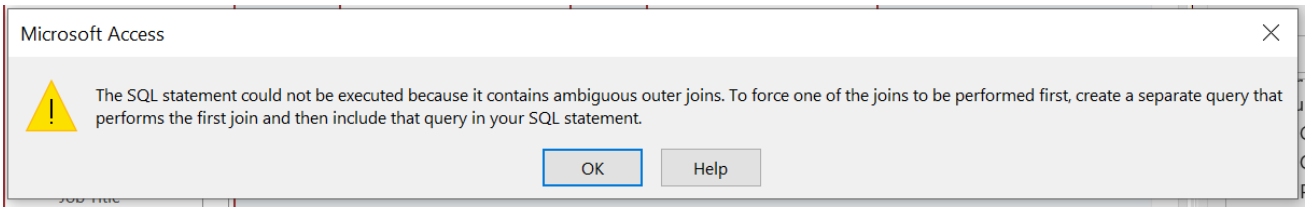
3.1. Once the query is saved, use the SQL view to show the underlying SQL. (Create a screen shot of the SQL with the SQL visible….)



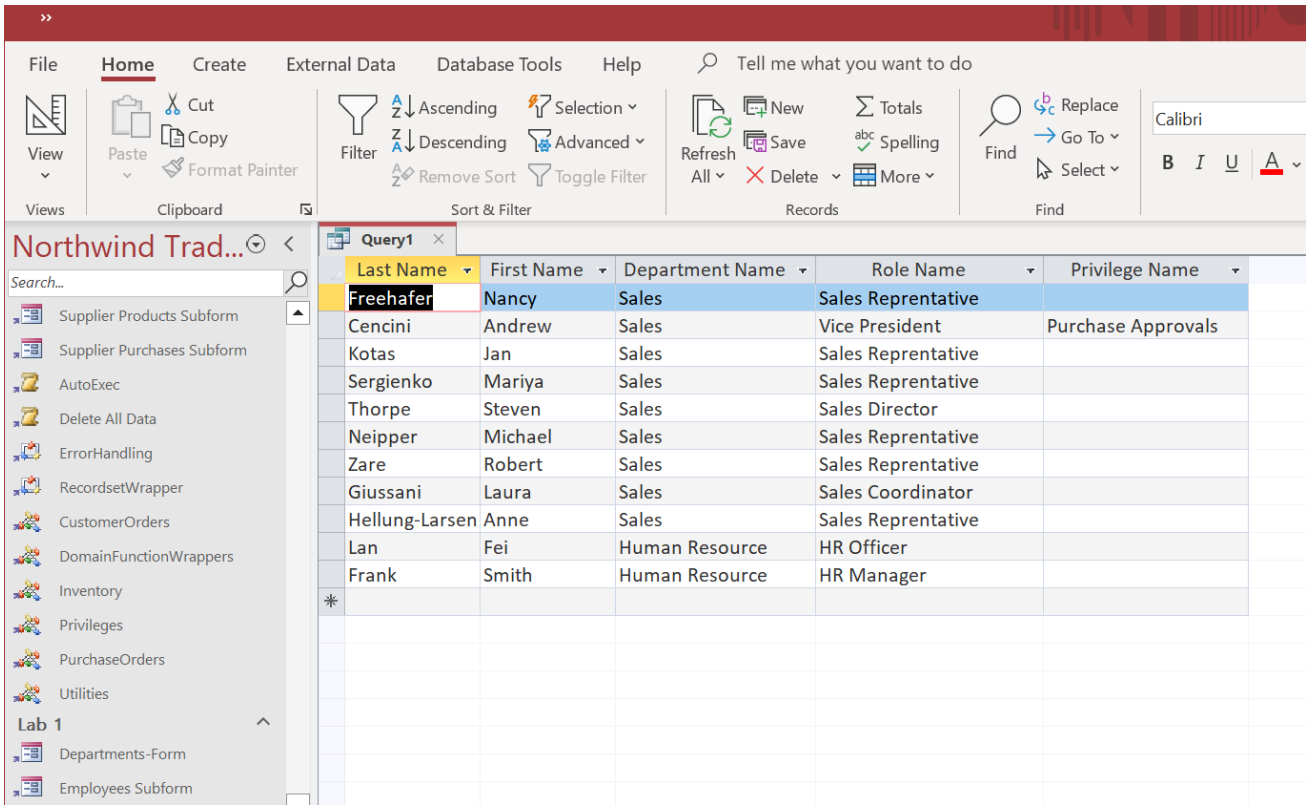
3.2. Try executing the query by moving to the Datasheet view. What happens? If you have errors adjust the relationships until the query runs. Show the result.

Answer: There is an error because of unambiguous outer joins between tables, and Datasheet view can't be generated.

© 2021 Algonquin College of Applied Arts and Technology



Change the relationship between Privileges table and Employee Privileges table from inner join or left joint to right join, then the query will work as the screen shot below.

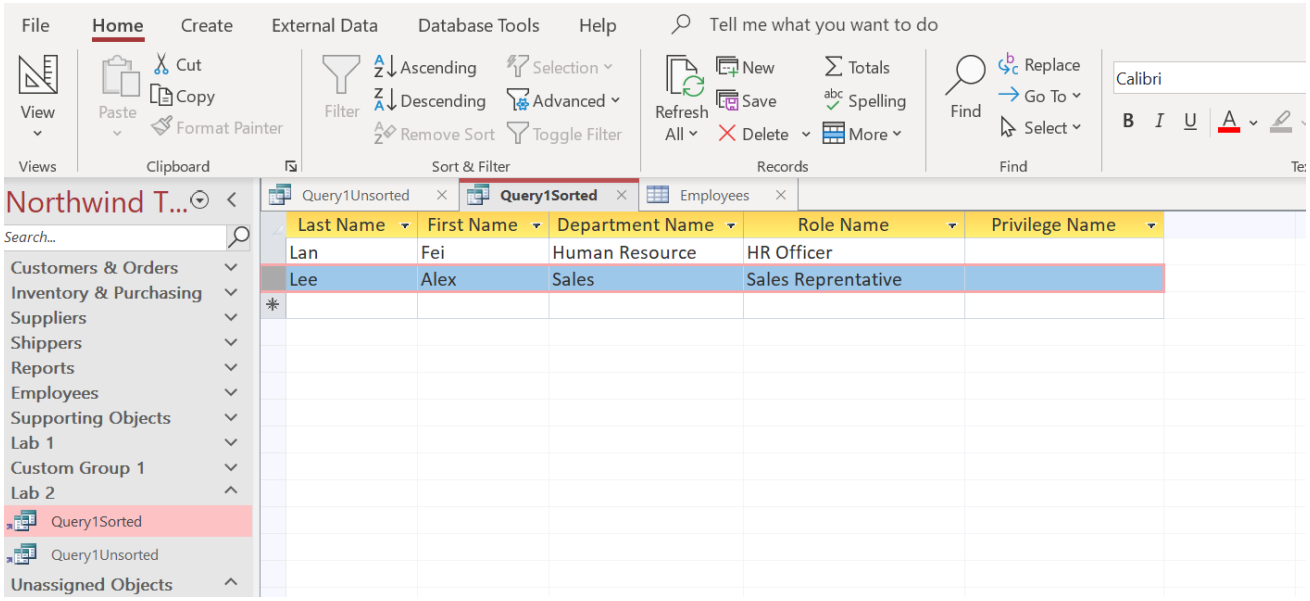


3.3. Save the Query as "Query1Unsorted" and move it to a new group called Lab2.

3.4. Edit the Query to select only employees with last names starting with the same first letter as your last name (for "King" that would be "K"). Include the following fields ("Lastname" (sorted ascending, "Firstname" (ascending), Department (ascending), Role (ascending), and Privilege (ascending). Add another employee to the employee table that has the same first letter in their last name. Save the new Query as Query1Sorted and move it the Lab2 group. Run the query and show the datasheet view below.

Another employee is added into Employees table, and his last name is "Lee", with the same first letter "L" as my last name "Lan". The screening shot is shown as below.

© 2021 Algonquin College of Applied Arts and Technology



3.5. Save and move the Query to the Lab2 Group with the name "Query1Sorted".

4. Create a report that groups all of the employees by their last names; with a heading of for each Alphabet letter; e.g., A followed by, B followed by, C, etc. Each grouping should contain the person's last name, first name, and role.

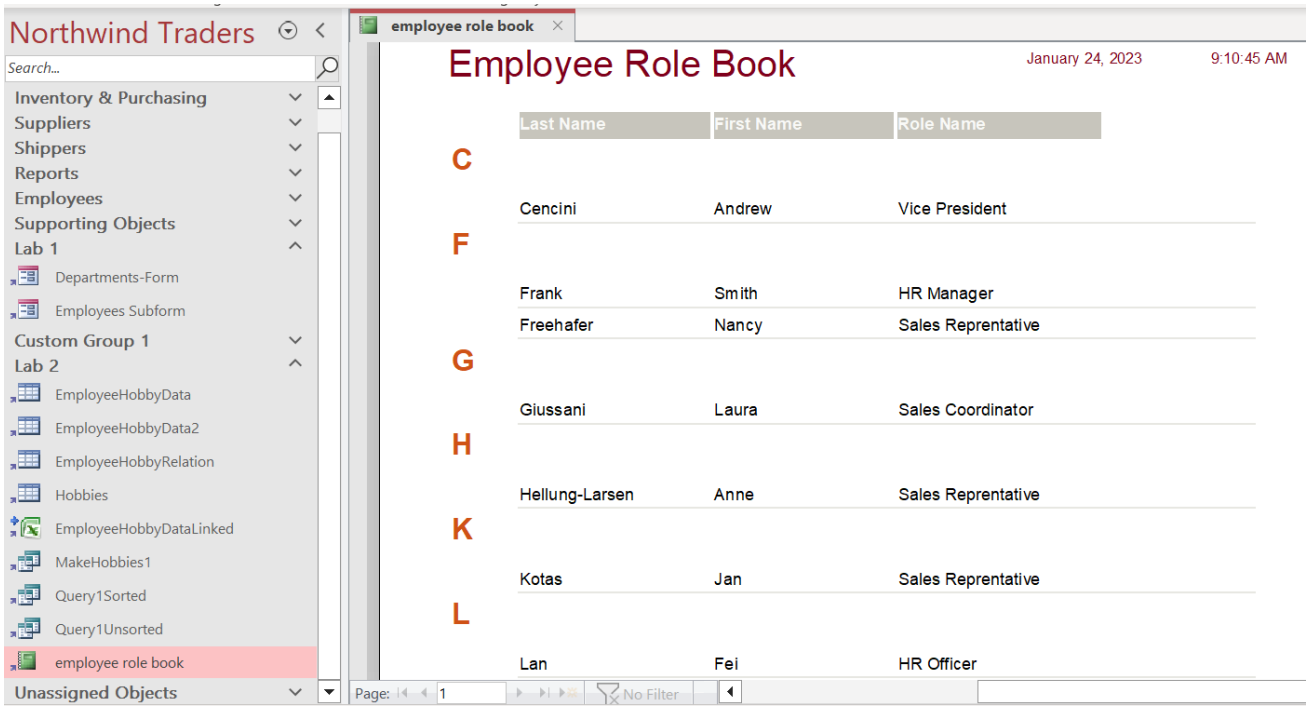
4.1. You should start by looking at the alphabetical employee address book. You can use it as a model to either edit the address book to become the roles book, or you can create a new one using a wizard.

4.2. You may need to create some new employees to get a nice screenshot

4.3. Show the resulting report below. Save it in the lab2 group as "employee role book".

This report shows each grouping contain the person's last name, first name, and role.

© 2021 Algonquin College of Applied Arts and Technology



5. Create an MS-Excel worksheet containing the hobbies for some employees.

   5.1. Start with an empty MS-Excel worksheet.

   5.2. In the first row, put the column headings: "RowNumber", Lastname", "Firstname", and "Hobby".

   5.3. Look at the employee data in the Northwind Database and enter some rows in the MS-Excel worksheet to show a hobby for an individual employee.

   5.4. Make sure you put at least two rows for your own name. (Note: this means that there will be two rows with the same Lastname and Firstname; the RowNumber will become the key when we move the data to Access). MAKE SURE THE NAMES MATCH THOSE IN THE Access DATABASE!

   5.5. Show a screenshot of your populated MS-Excel table below.

© 2021 Algonquin College of Applied Arts and Technology

	A	B	C	D	E	F	G
1	RowNumber	LastName	FirstName	Hobby			
2	1	Freehafer	Nancy	Fishing			
3	2	Cencini	Andrew	Swimming			
4	3	Kotas	Jan	Reading			
5	4	Sergienko	Mariya	Music			
6	5	Thorpe	Steven	Hockey			
7	6	Neipper	Michael	Skiing			
8	7	Zare	Robert	Bascketball			
9	8	Giussani	Laura	Swimming			
10	9	Hellung-Larsen	Anne	Fishing			
11	10	Lan	Fei	Shopping			
12	11	Lan	Fei	Piano			
13	12	Frank	Smith	Skiing			
14	13	Lee	Alex	Music			
15							

6. Using the “External Data” menu, import the data from the MS-Excel worksheet (use RowNumber as the primary key).

   6.1. When prompted near the end of the pop-ups, you should save the steps as “Import-employee-hobby-data” to allow for a quick re-import.

   6.2. Save the imported table as “EmployeeHobbyData”. Provide a screenshot of the table contents.

7. Update the MS-Excel worksheet and re-import it with a new name using the following steps:

   7.1. Update the MS-Excel worksheet containing the employee hobby data. Show a screenshot of the updated table.

   The hobby of Alex Lee is changed from "Music" to "Reading".

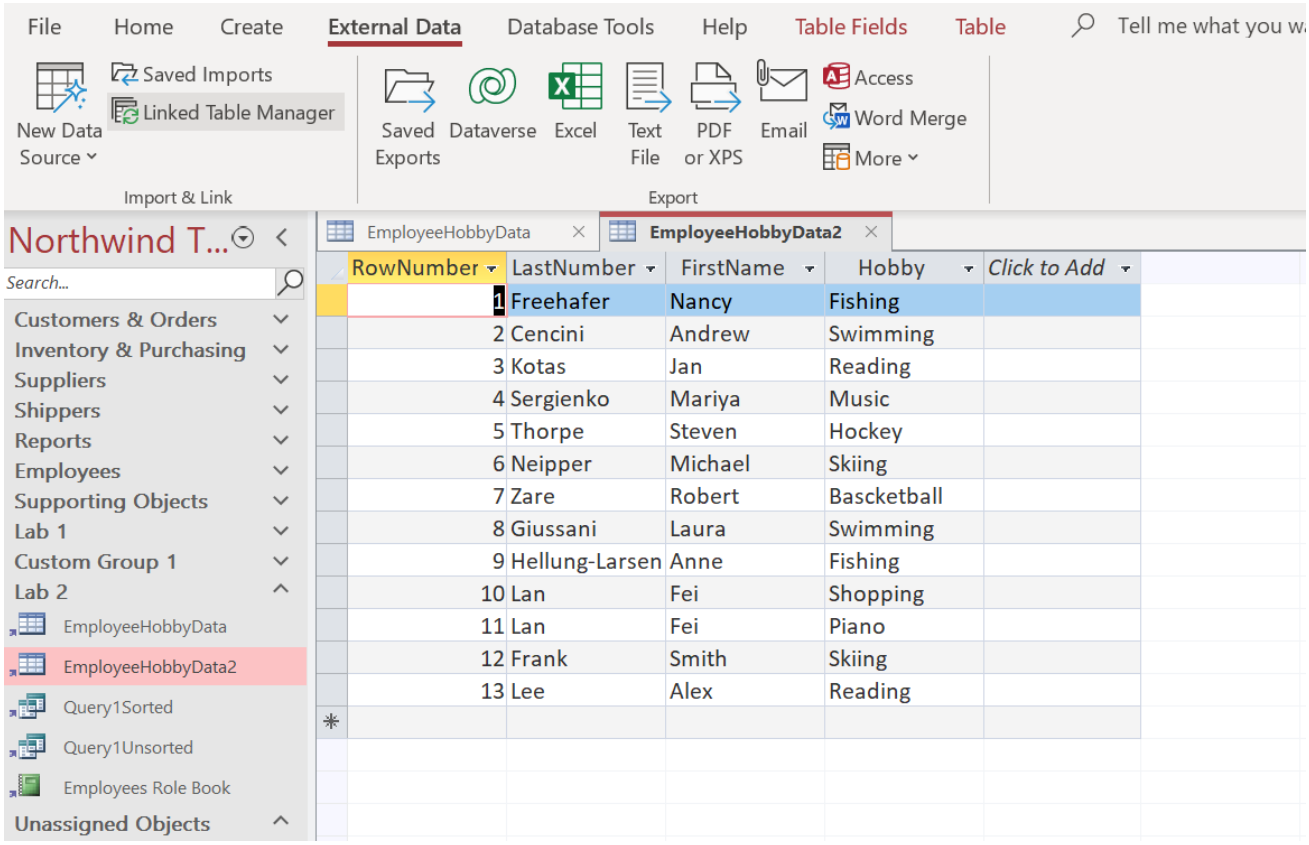
	A	B	C	D	E	F	G
1	RowNumber	LastName	FirstName	Hobby			
2	1	Freehafer	Nancy	Fishing			
3	2	Cencini	Andrew	Swimming			
4	3	Kotas	Jan	Reading			
5	4	Sergienko	Mariya	Music			
6	5	Thorpe	Steven	Hockey			
7	6	Neipper	Michael	Skiing			
8	7	Zare	Robert	Bascketball			
9	8	Giussani	Laura	Swimming			
10	9	Hellung-Larsen	Anne	Fishing			
11	10	Lan	Fei	Shopping			
12	11	Lan	Fei	Piano			
13	12	Frank	Smith	Skiing			
14	13	Lee	Alex	Reading			
15							

7.2. Re-import the worksheet into the "EmployeeHobbyData2" table (note the new name!) Show a screenshot of the updated data.

The screen shot with the updated data for Alex Lee's hobby with "Reading".

© 2021 Algonquin College of Applied Arts and Technology



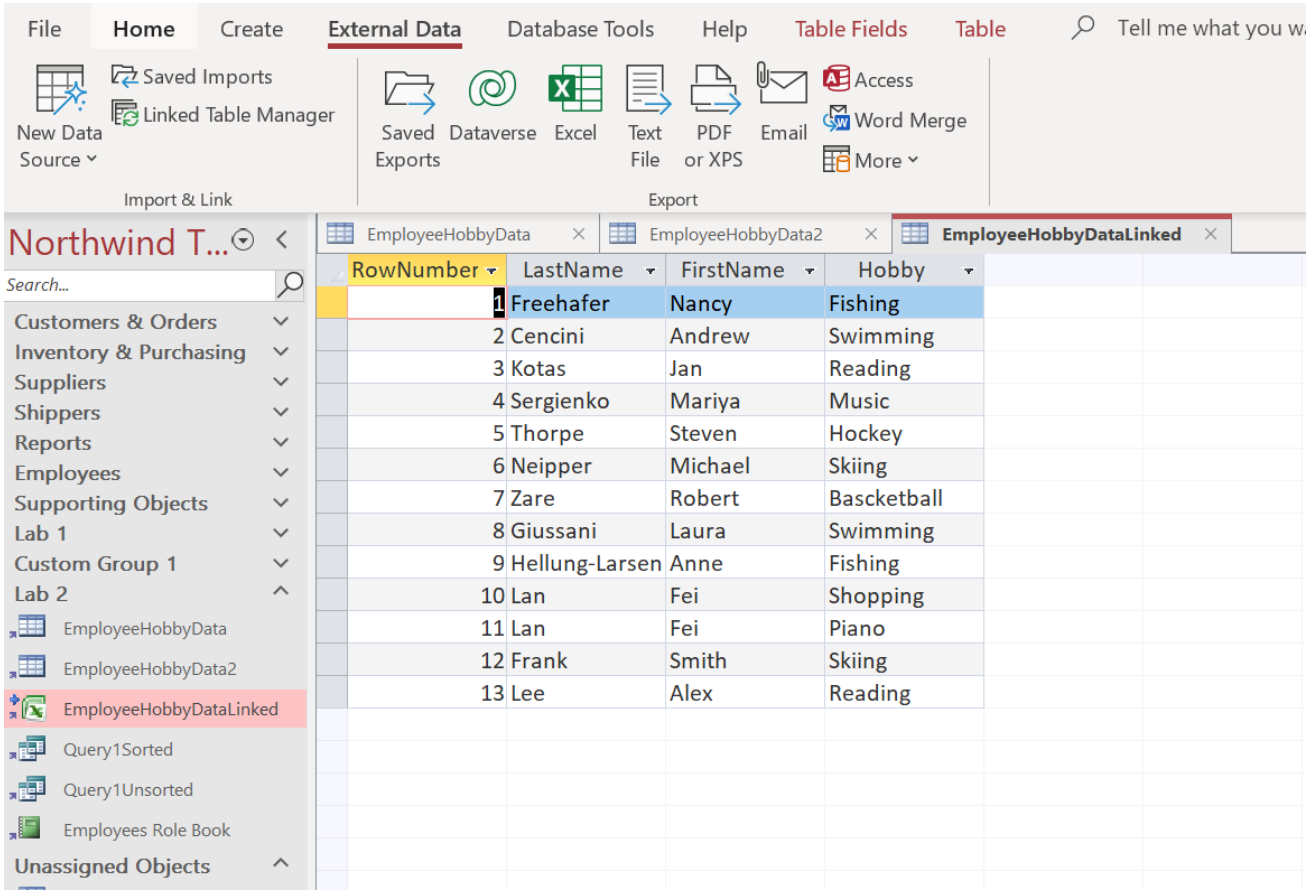
8. Using the "External Data" menu, **link** to the data in the MS-Excel worksheet (use RowNumber as the primary key).

   8.1. Save the imported table as "EmployeeHobbyDataLinked".

   8.2. After the linking is complete, open the linked table from inside Access and provide a screenshot. You should see the updated data.

The screen shot with the updated data for Alex Lee's hobby with "Reading".

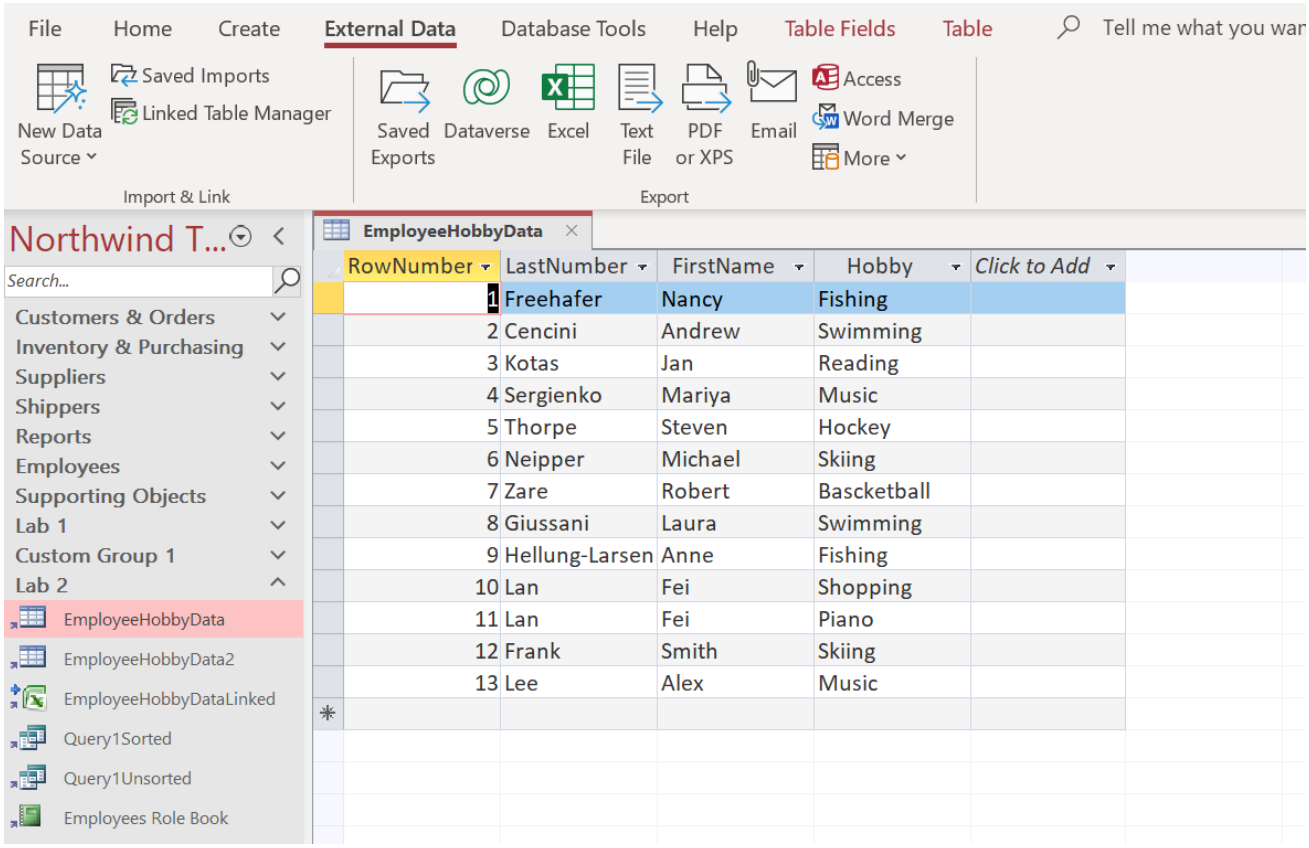
© 2021 Algonquin College of Applied Arts and Technology



8.3. Open the "EmployeeHobbyData" table that you had imported and provide a screenshot. You should see the original data.

The screen shot with the original data for Alex Lee's hobby with "Music".

© 2021 Algonquin College of Applied Arts and Technology



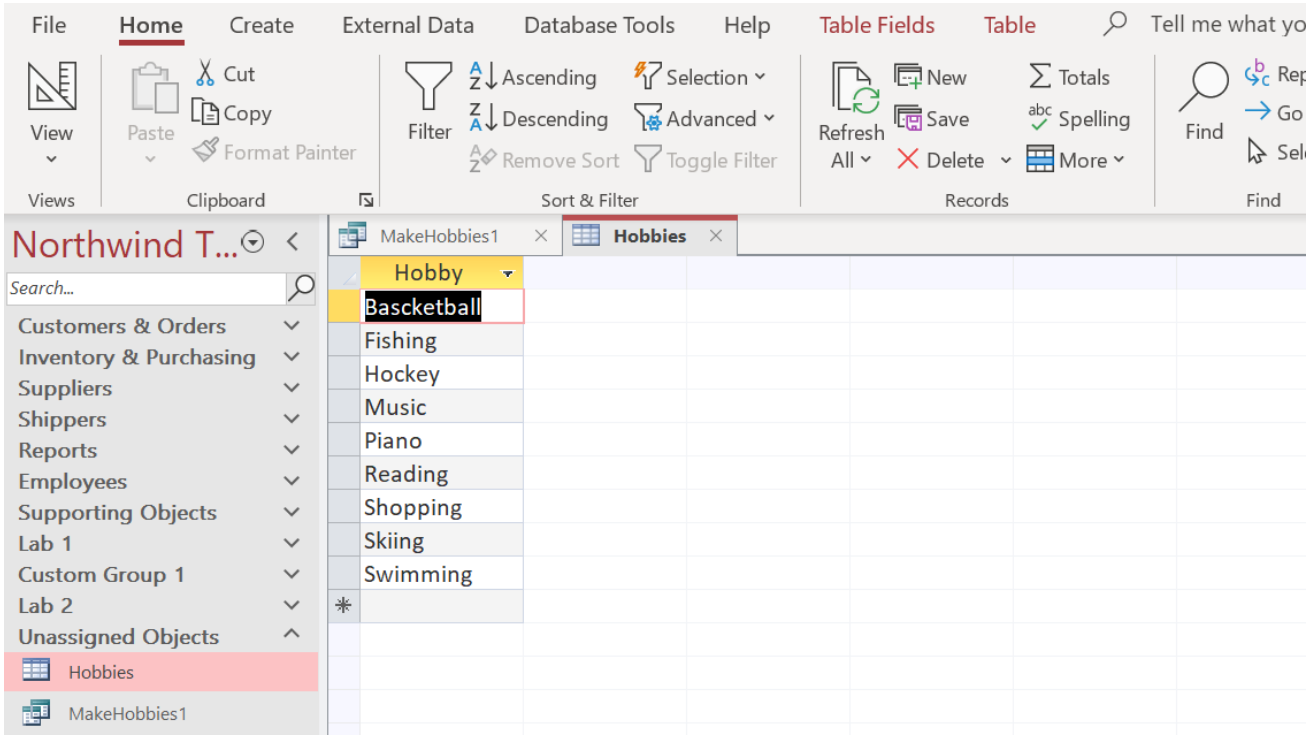
9. Using the following steps, create a new table that contains each of the unique hobbies; with a new field "HobbyID" (which is an AutoNumber key), and "HobbyName". You will need to design a query that selects the appropriate list, and then use it as a make table query.

   9.1. Create a new "Select" query that produces the set of unique hobbies by using the DISTINCT keyword. Save the query as MakeHobbies1.

   9.2. Modify MakeHobbie1 to be a Make Table Query, and then save it. Run the query carefully and store the resulting table as "Hobbies".

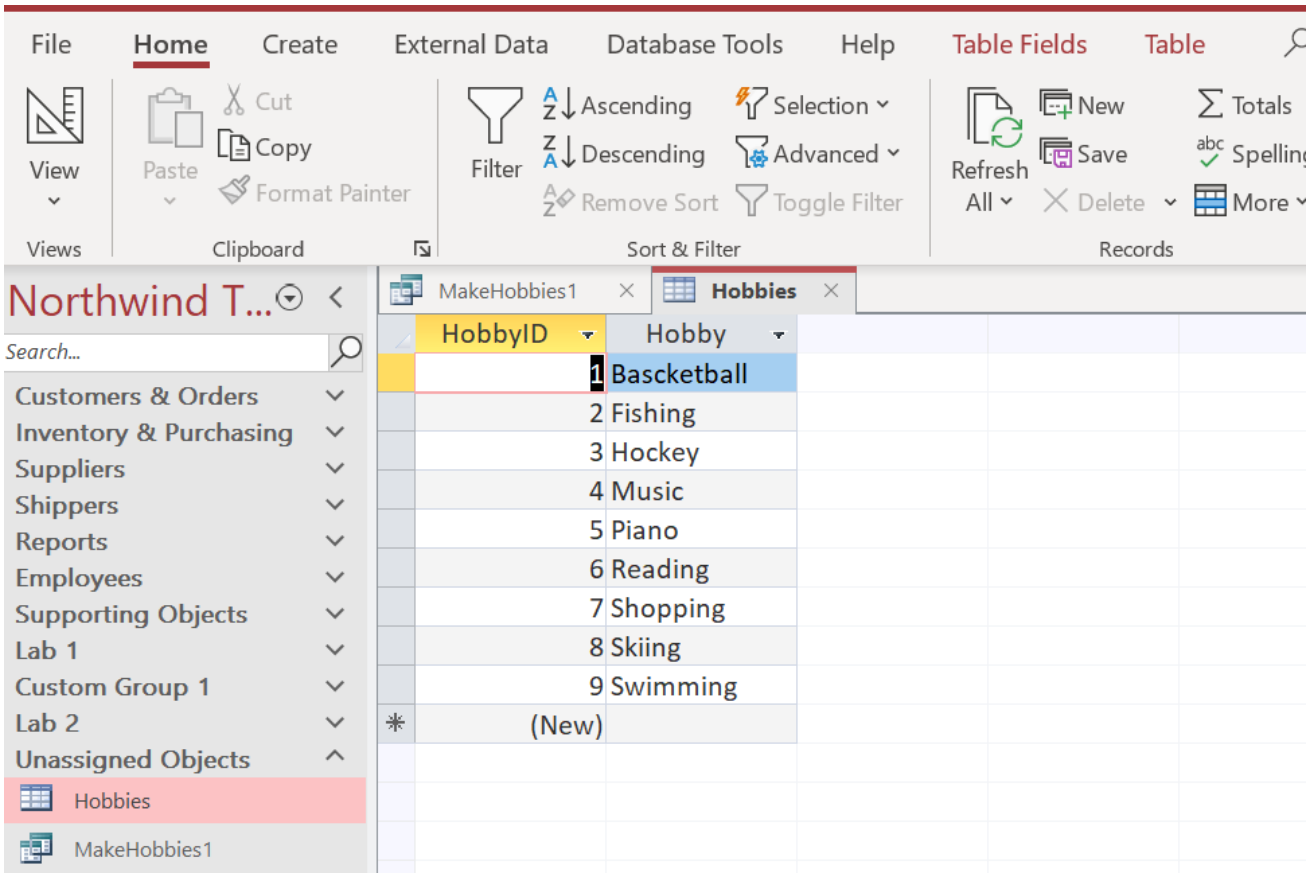
   9.3. Open the new Hobbies table in DataSheet View and take a screenshot.

© 2021 Algonquin College of Applied Arts and Technology



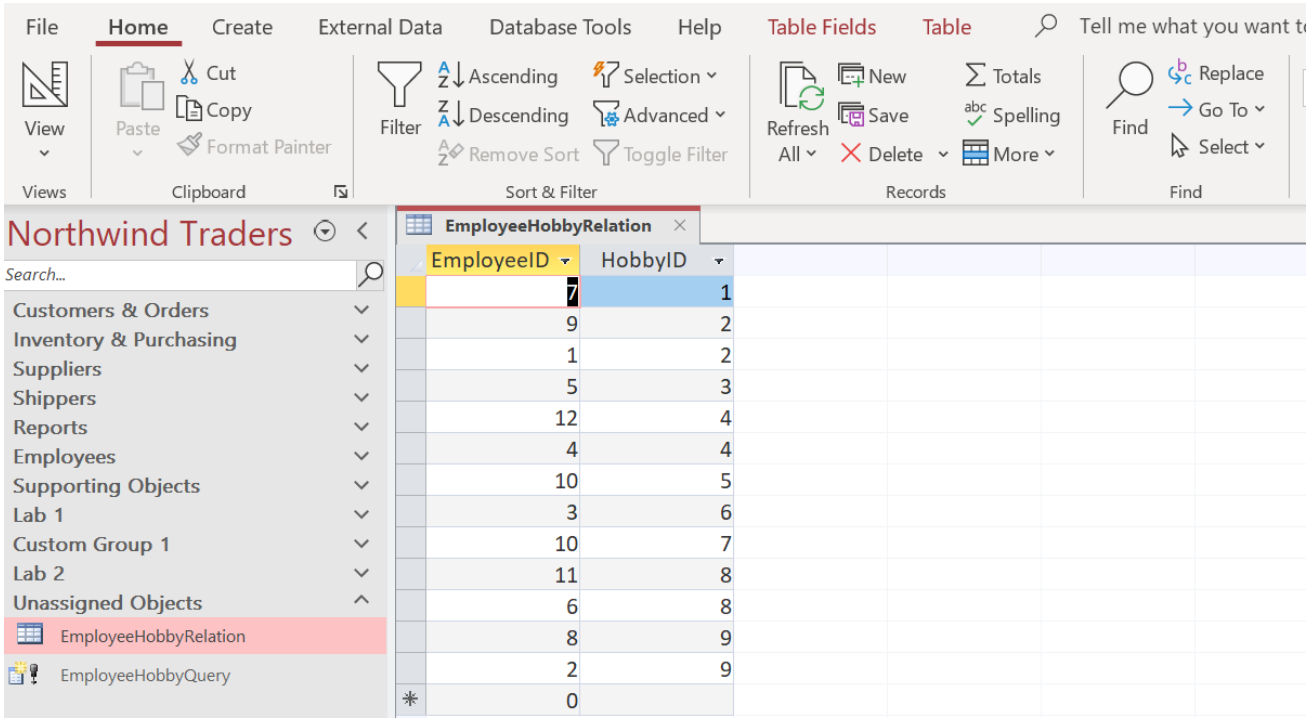
9.4. Open the Hobbies table in Design View, and add “HobbyID as an Auto Number primary key. Save the table. Take a screenshot of the finished Hobbies table with the populated keys.

© 2021 Algonquin College of Applied Arts and Technology

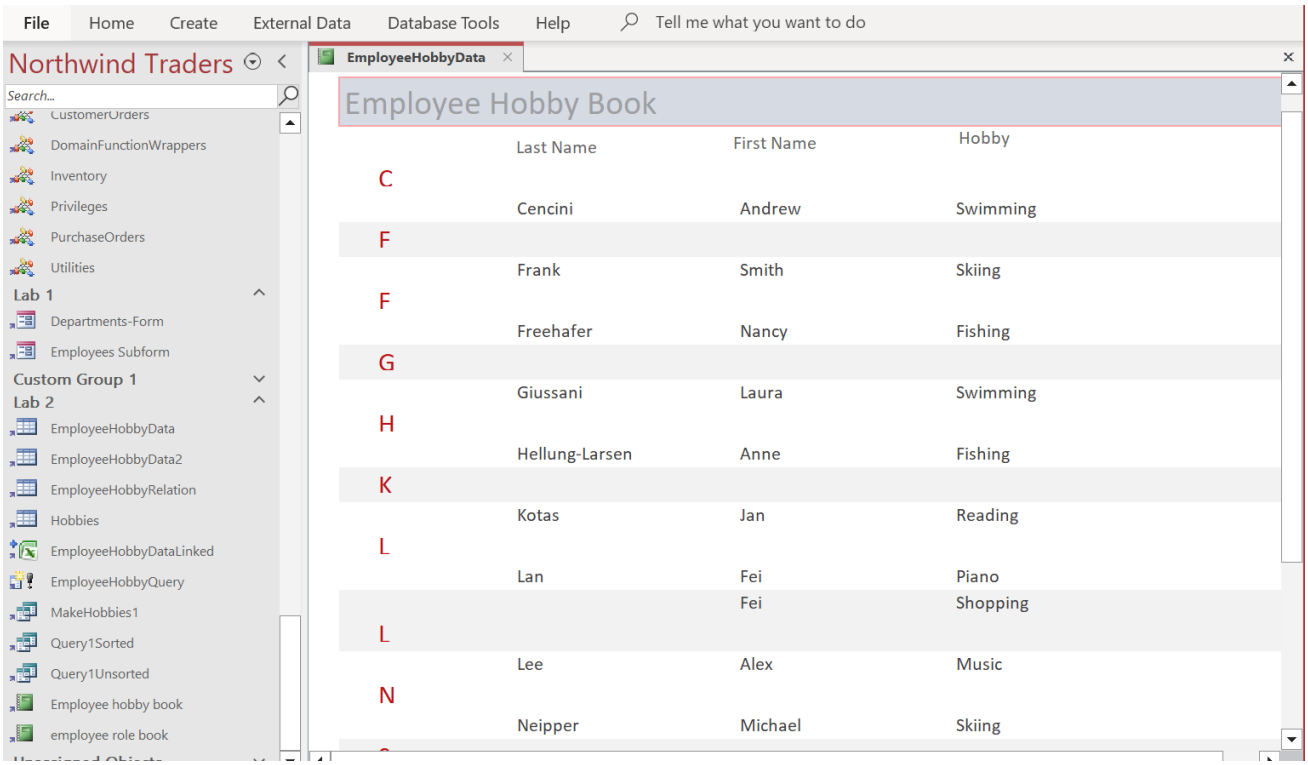


10. Following a similar process as for Step 9 above, use the Make Table feature to create a new table to hold the many-to-many relationship with the fields “EmployeeID”, and “HobbyID” that is populated with the data from the joined Employees, Hobbies, and EmployeeHobbyData tables.

© 2021 Algonquin College of Applied Arts and Technology

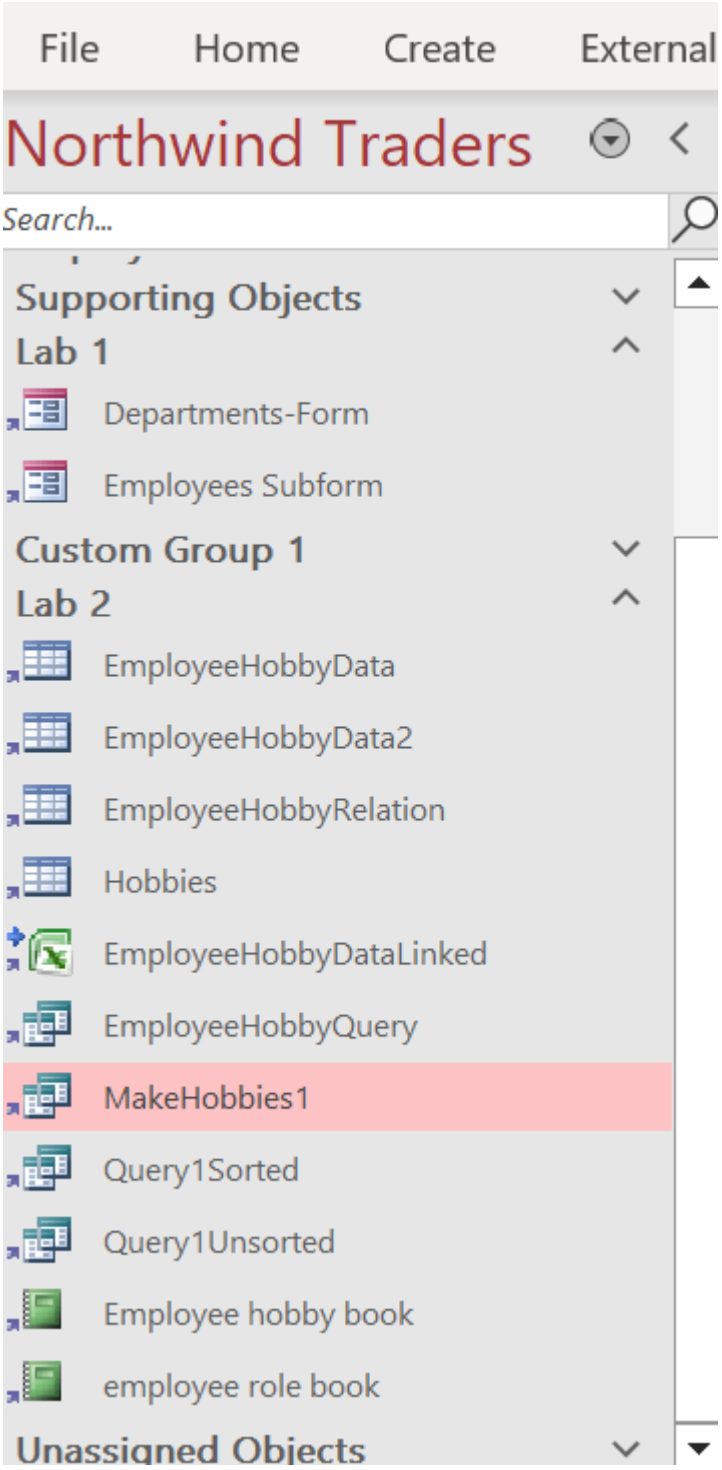


11. Create a new report based on the employee role report that shows the hobbies instead of roles. Provide a screenshot.



© 2021 Algonquin College of Applied Arts and Technology

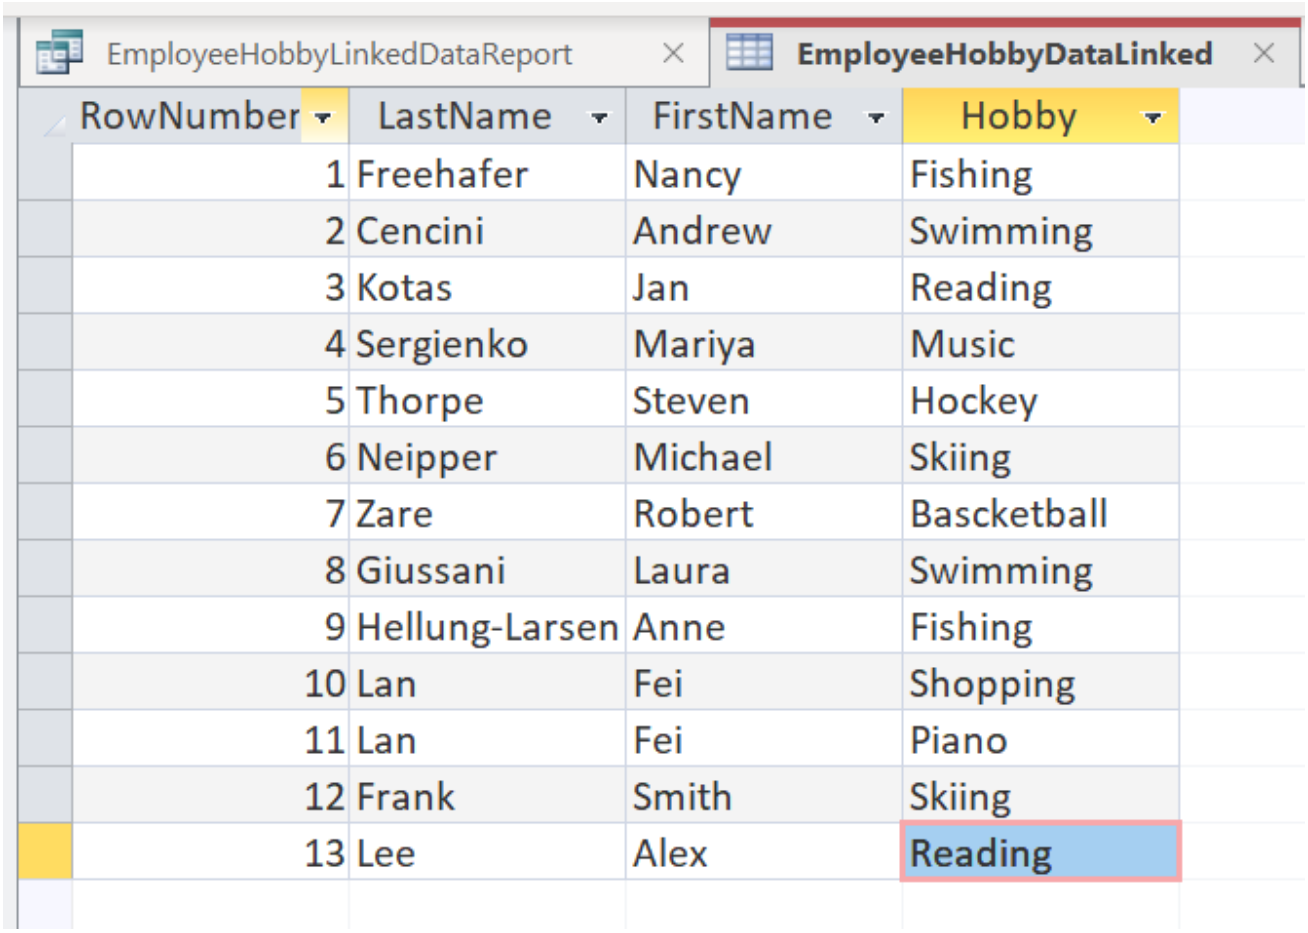
12. Tidy up your work into groups for lab1 and lab2. Take a screenshot showing the resulting groupings.



© 2021 Algonquin College of Applied Arts and Technology

13. OPTIONAL BONUS (to ensure 100%): Create a modified version of the employee hobbies report that uses the data from the linked EmployeeHobbyDataLinked table rather than the EmployeeHobbyData table. Provide a screenshot. It should show the current data values at the time the report is generated (the new values!)

The screen shot of EmployeeHobbyDataLinked table, with updated hobby "Reading" for Alex Lee.



EmployeeHobbyLinkedDataReport | **EmployeeHobbyDataLinked**

RowNumber	LastName	FirstName	Hobby
1	Freehafer	Nancy	Fishing
2	Cencini	Andrew	Swimming
3	Kotas	Jan	Reading
4	Sergienko	Mariya	Music
5	Thorpe	Steven	Hockey
6	Neipper	Michael	Skiing
7	Zare	Robert	Bascketball
8	Giussani	Laura	Swimming
9	Hellung-Larsen	Anne	Fishing
10	Lan	Fei	Shopping
11	Lan	Fei	Piano
12	Frank	Smith	Skiing
13	Lee	Alex	Reading

The screen shot for employee hobbies report that uses the data from the linked EmployeeHobbyDataLinked table, with updated hobby "Reading" for Alex Lee.
